when von neumann s and morgenstern s theory of games and economic behavior appeared in 1944 one thought that a complete theory of strategic social behavior had appeared out of nowhere however game theory has to this very day remained a fast growing assemblage of models which have gradually been united in a new social theory a theory that is far from being completed even after recent advances in game theory as evidenced by the work of the three nobel prize winners john f nash john c harsanyi and reinhard selten two of them harsanyi and selten have contributed important articles to the present volume this book leaves no doubt that the game theoretical models are on the right track to becoming a respectable new theory just like the great theories of the twentieth century originated from formerly separate models which merged in the course of decades for social scientists the age of great discoveries is not over the recent advances of today s game theory surpass by far the results of traditional game theory for example modern game theory has a new empirical and

social foundation namely societal experiences this has changed its methods its rationality morgenstern i worked together with him for four years dreamed of an encompassing theory of social behavior with the inclusion of the concept of evolution in mathematical form this dream will become true perhaps the new foundation will even lead to a new name conflict theory instead of game theory

this volume contains twelve of my game theoretical papers published in the period of 1956 80 it complements my essays on ethics social behavior and scientific explanation reidel 1976 and my rational behavior and bargaining equilibrium in games and social situations cambridge university press 1977 these twelve papers deal with a wide range of game theoretical problems but there is a common intellectual thread going though all of them they are all parts of an attempt to generalize and combine various game theoretical solution concepts into a unified solution theory yielding one point solutions for both cooperative and noncooperative games and covering even such non classical games as games with incomplete information section a the first three papers deal with bargaining models the first one discusses nash s two person bargaining solution and shows its equivalence with zeuthen s bargaining theory the second considers the rationality postulates underlying the nash zeuthen theory and defends it against schelling s objections the third extends the shapley value to games without transferable utility and proposes a solution concept that is at the same time a generaliza tion of the shapley value and of the nash bargaining solution

in a ground breaking series of articles one of them written by a nobel laureate this volume demonstrates the evolutionary dynamic and the transformation of today s democratic societies into scientific democratic societies it highlights the progress of modeling individual and societal evaluation by neo bayesian utility theory it shows how social learning and collective opinion formation work and how democracies cope with randomness caused by randomizers nonlinear evolution equations and serial stochastic matrices of evolutionary game theory allow us to optimally compute possible serial evolutionary solutions of societal conflicts but in democracies progress can be defined as any positive gradual innovative and creative change of culturally used transmitted and stored mentifacts models theories sociofacts customs opinions artifacts and technifacts within and across generations the most important changes are caused besides randomness by conflict solutions and their realizations by citizens who follow democratic laws these laws correspond to the extended pareto principle a supreme socioethical democratic rule according to this principle progress is any increase in the individual and collective welfare which is achieved during any evolutionary progress central to evolutionary modeling is the criterion of the empirical realization of computed solutions applied to serial conflict solutions decisions evolutionary trajectories are formed they become the most influential causal attractors of the channeling of societal evolution democratic constitutions legal systems etc store all advantageous present and past adaptive competitive cooperative and collective solutions and their rules they have been accepted by majority votes societal laws are codes of statutes default or statistical rules and they serve to optimally solve societal conflicts in analogy to game theoretical models or to statistical decision theory such solutions become necessary when we face harmful or advantageous random events always lurking at the edge of societal and external chaos the evolutionary theory of societal evolution in democracies presents a new type of stochastic theory it is based on default rules and stresses realization the rules represent the change of our democracies into information science and technology based societies

they will revolutionize social sciences especially economics their methods have already found their way into neural brain physiology and research into intelligence in this book neural activity and the creativity of human thinking are no longer regarded as linear deductive only evolutive nonlinear thinking can include multiple causal choices by many individuals and the risks of internal and external randomness this serves the increasing welfare of all individuals and society as a whole evolution and progress in democracies is relevant for social scientists economists evolution theorists statisticians philosophers philosophers of science and interdisciplinary researchers
